

Sustainability

Lendlease aspires to undertake design and construction activities on the Gateway Upgrade North Project in line with the Lendlease Engineering Environment Policy, Lendlease Sustainability Framework and the Department of Transport and Main Roads Scope of Works and Technical Criteria (Appendix 20 – Sustainability).

Lendlease make a commitment to continual improvement with the aspiration of achieving net positive impacts by means of restorative actions both during design and construction phases of the project.

The Lendlease Project team aspires to:

- ensure that people's health and wellbeing are put first
- explore available clean energy options for both design and construction
- reduce our reliance on potable water by exploring alternatives
- promote workforce development opportunities
- reduce waste to landfill by reducing, reusing, recycling or refusing
- pursue and reward innovation in design and construction
- consider environmental, social, economic and governance outcomes in our significant decisions
- engage with our suppliers and subcontractors to procure materials and use them responsibly
- work with the local community to leave a positive legacy
- include strategies for adaptation to climate change into our design
- advance diversity and inclusiveness
- respect and value the natural environment and enhance biodiversity.

Collectively these initiatives, in coordination with the objectives and targets detailed within the Lendlease Project Sustainability Management Plan, will ensure the project optimises environmental, social, economic and governance outcomes.

Warren Crowther
